The ten most common alphabet characters are used to construct our first 1000 significant digits. In fact, the letters a to j are used only 50% of the time and can be left out in our conversion. (the next 11 characters we need are found in the chart to the right) The next 1000 significant digits are constructed based on the ten most common letters of the alphabet, but the frequencies of the letters are adjusted to account for the fact that "a" and "j" are already used once. So, in addition to the 50% of the letters that are never used, the next 11 characters are also used only 50% of the time, and thus we need 8 more for a total of 4080 letters. To give you some perspective, a total of 1500000 significant digits were entered in the chart to the right! As time goes by, the chart contains only the letters that are more useful than before. We are constantly adding more to the chart, e.g. "k", "o", "q", and "s". History and Notes: The chart shows only characters that occur in the top 1/5th of the alphabet, up to the next 11th character. The next character in the chart isn't used. This is the most common method of constructing significant digits, but other methods are possible and tested. The chart can be extended to 1400 significant digits if you wish. At the bottom of the chart, you will find some "history" explanations. This chart is an update of a JavaSciChart chart first mentioned by Dr Prashant Sharma on the SciChart mailing list. About the Math Algorithm: The Basic Algorithm: The algorithm is based on the "Crow's Foot Algorithm" used in the standard IEEE- Standard 754 floating-point format. While the format handles floating-point numbers in which the exponent is an integer, the algorithm expands on this simple format by multiplying the mantissa by 10 to the power of the exponent, and normalizing. This can be used to represent the number in binary using the most common letters of the alphabet. 1. Create a mask Mask used when rounding the mantissa to the nearest power of 2. Example: When using the mask 6, we have: 00101 - add the least significant bit to "00" In the same way, we obtain the next mantissa
